Project 1 Redesign

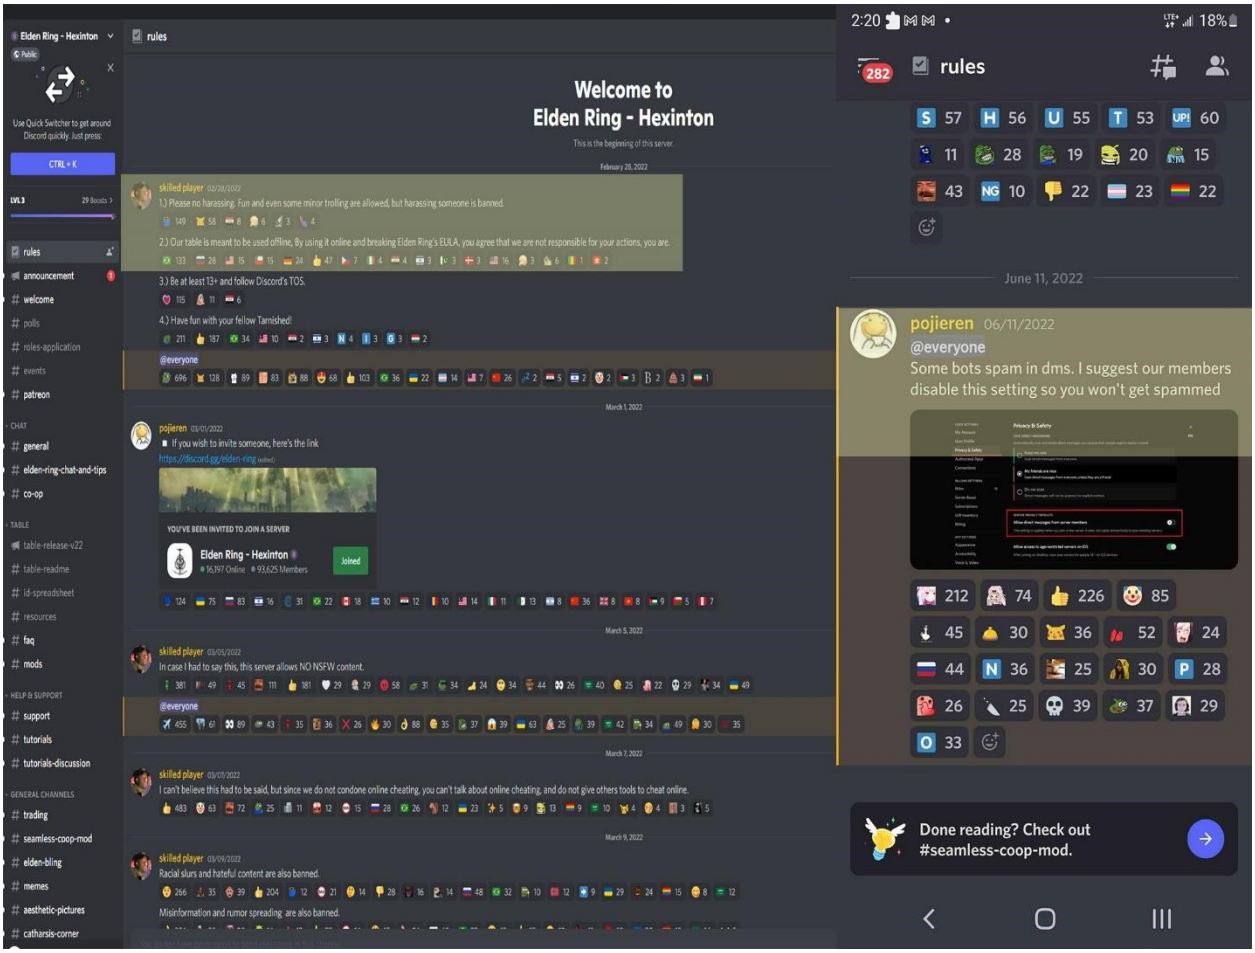

Violations of Usability and Design Principles

Usability Goals Violation 1 Utility :

Above is an example of a violation of having good utility. The app in question is known as discord which has been probably used by almost everyone. The way the apps violate this usability goal is that not every user is able to accomplish their task. An example of this are shown in the images above showing that the user is unable to send a file on either the mobile application , web browser or program on pc. This feature is very important as many individuals have in some instances send files to friends or colleagues but in this case if said file is bigger

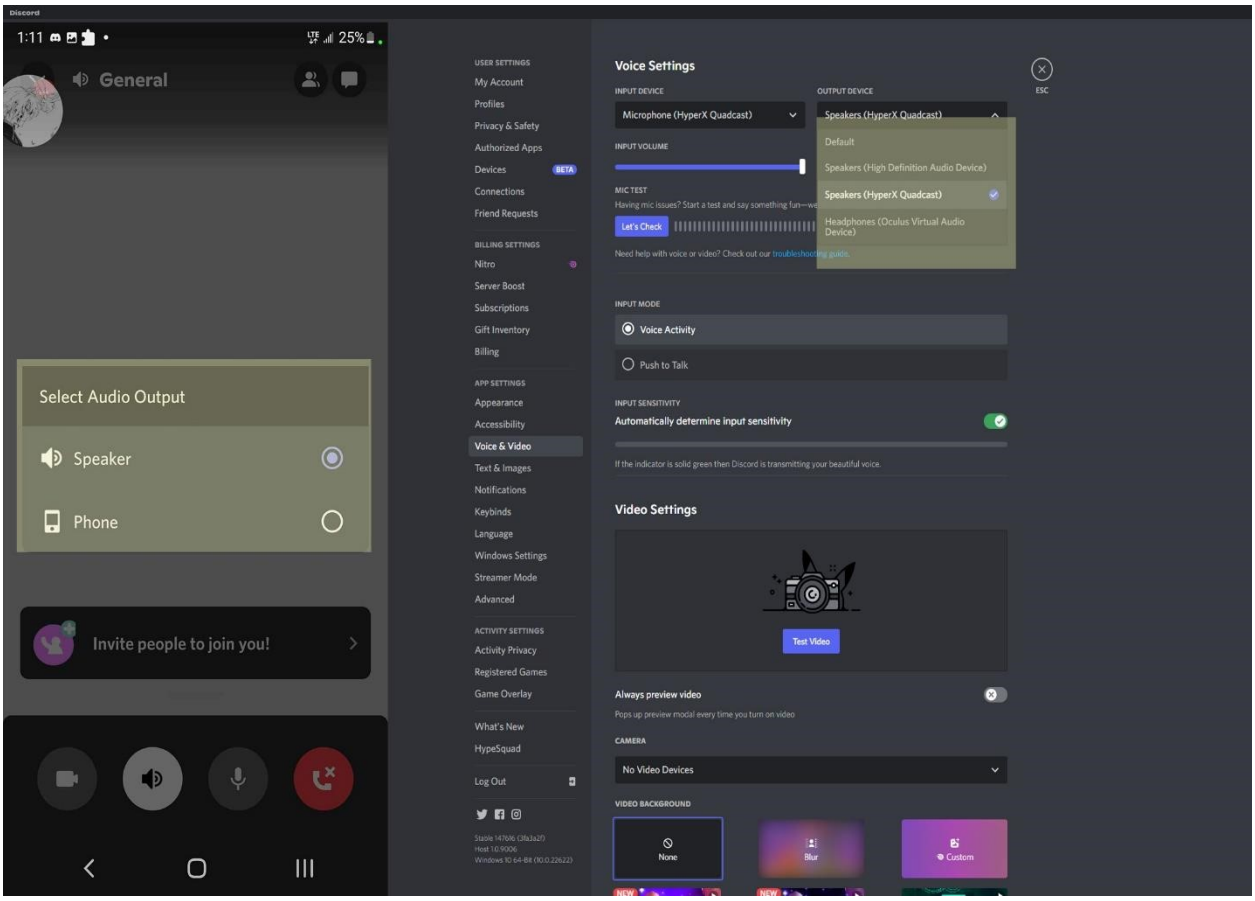

than an amount they are either required to find an alternative method or buy a subscription which is still only 100MB.

Usability Goals Violation 2 Safety :

Above is an example of the violation for safety. The image provided above shows two pictures one on the right on mobile and the other one on the website. Although, this user mentioned not to harass there is a potential for such an issue to occur as any one can join and post or chat with anyone. Furthermore, it is important to note that following along in the posts it mentions that

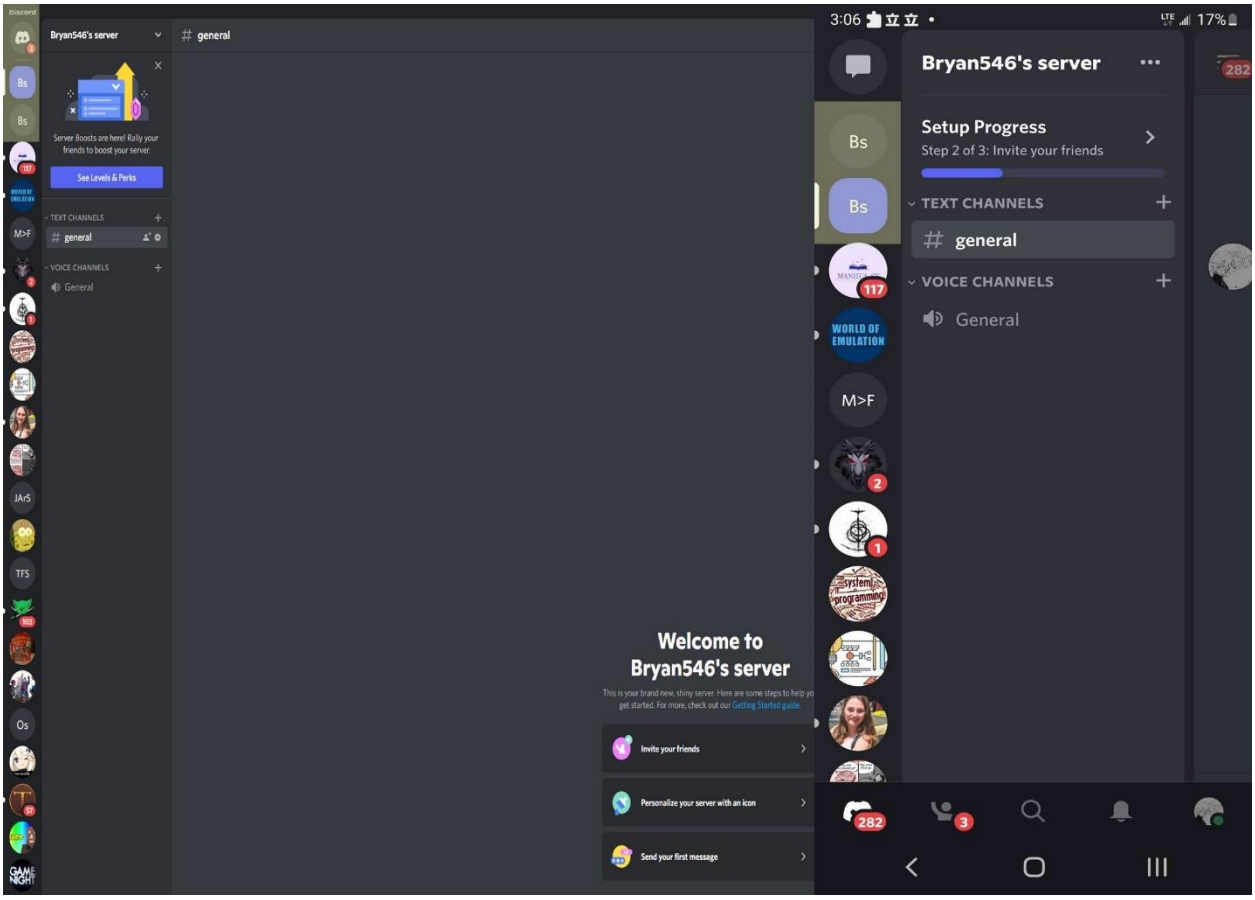

nsfw is not allowed although this is a singular individual and possibly a moderator if a user desires to do any mischief they can tag everyone in the server either with a bot or with a mention. This can lead to malicious files or nsfw images being sent to individuals. Measures to prevent this are usually that the moderator has the ability to ban said individual or users can block them and delete the message from their app.

Usability Goals Violation 3 Effectiveness :

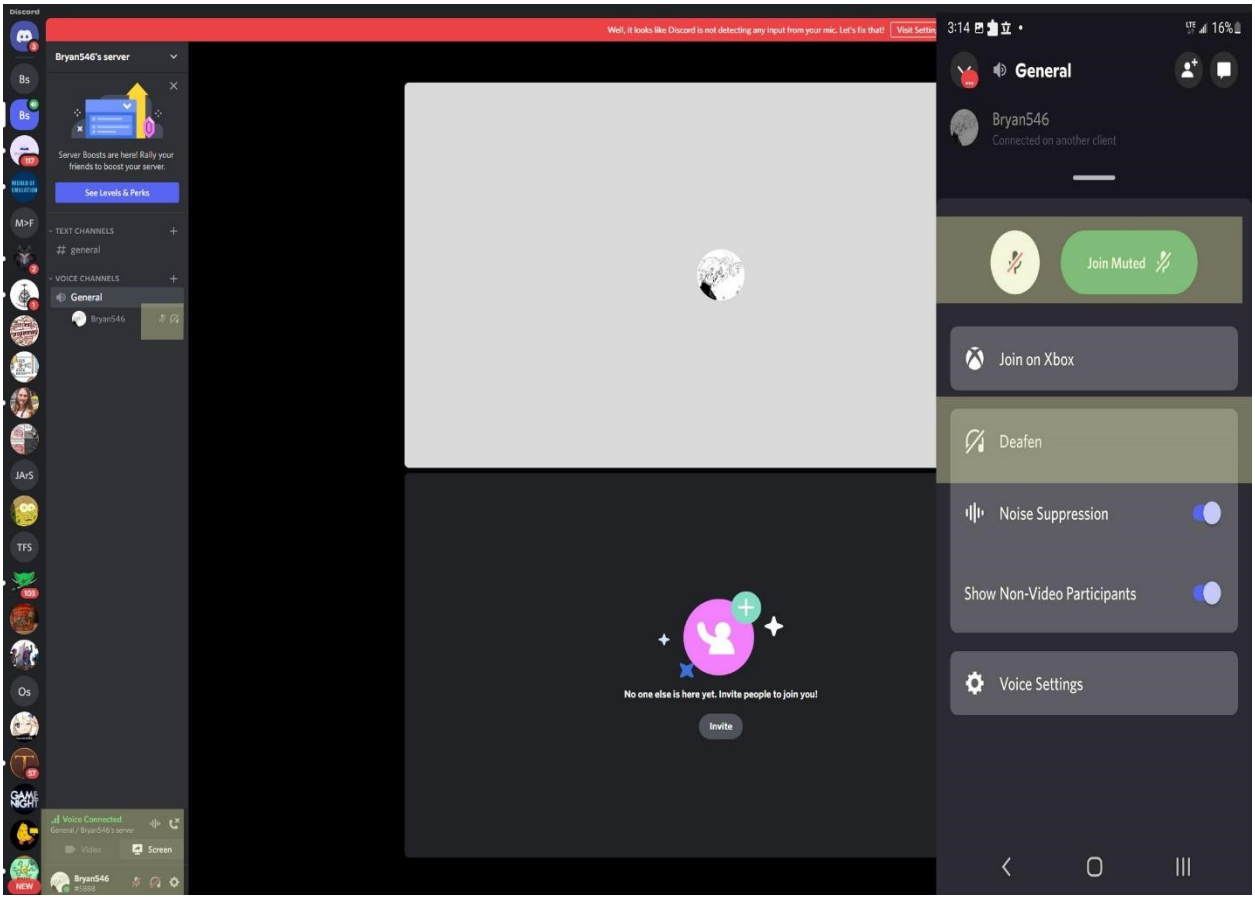

The image above is a scenario in which the app/website or program can sometimes decide what device to use although the specific issue is not shown it can happen at random times during the calls. This issue seems to act like a reset on the voice settings and can sometimes lead to a rabbit

hole as the user is figuring out if the device they are using is experiencing issues or if it is indeed the settings of said app. Furthermore, above the images shown are two different instances with the one on the right having four options to choose default, Hyperx, High definition audio device and the oculus. This can lead to the user having to pick one by going into the audio settings and testing if that's the correct mic or if said settings decide to revert itself. It can cause the mic to not work and other friends or colleagues in voice chats would not be able to hear the individual speak causing the user to search for the problem.

Design Principles Violation 1 Visibility :

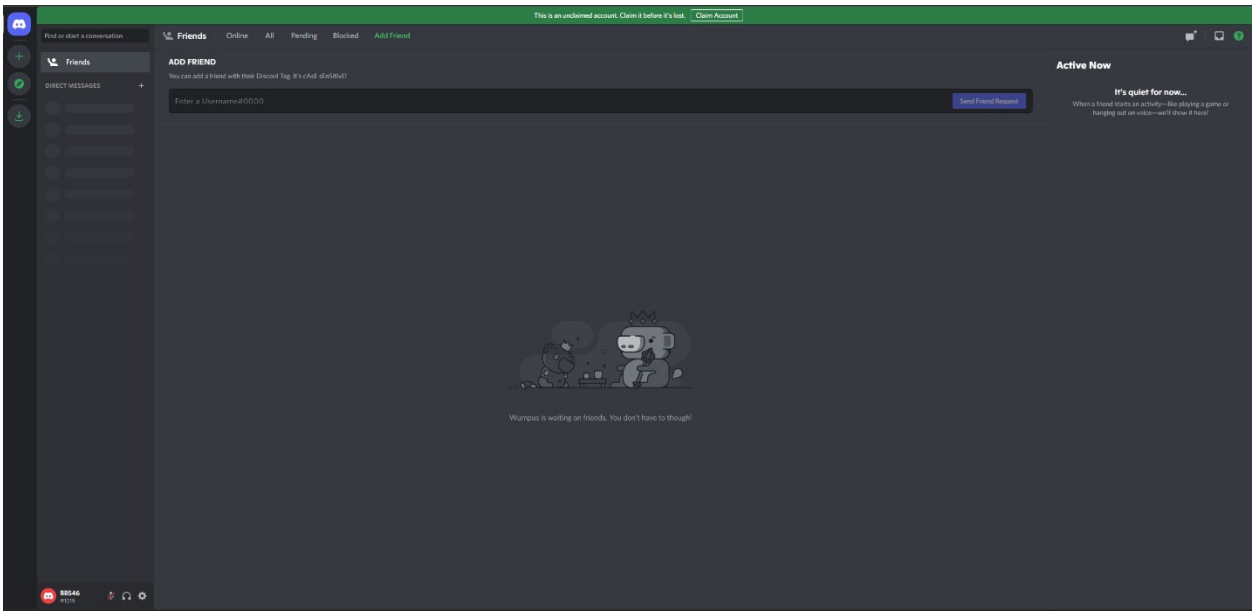

Above we can see a violation of visibility. This is because if we look at the two highlighted portions in the image we can see that there are two servers with the same initial Bs. This can lead to an issue if multiple people decide to create a server and not customize the icon. Furthermore, if the server shares a similar name take for example a user who is named Bryan and decides to create a server. This would cause the server name to simply be named Bs as shown in the icon unless they change the name of the server and icon which can cause certain individuals confusion if the same image or similar name is used for the servers.

Design Principles Violation 2 Consistency/Constraints :

The image provided above shows the layouts of some icons in this case the mute and deafen buttons which technically serve the same purpose. The only difference is a user is able to mute

the whole chat or simply the mic the issue of this comes when the user decides to either mute or deafen as the sound that is played is very similar to each other. This can lead to issues on which one may think they muted but in fact deafened and are not able to hear everyone. Another violation can probably be the constraints as mentioned previously a user that wants to cause mischief on a server is absolutely able to by simply either uploading a malicious file or simply spamming or posting images that are NSFW.

Design Principles Violation 3 Affordances :

The image above shows that once the user decides to create an account on discord they are tossed into it. An example of this is if the user is using multiple devices that have audio and the issue of the voice pops up. But, the user is just getting into using the app or website they would probably have no idea where to navigate to fix that certain issue possibly relying on the internet for help.

Part 2 Goal Identification:

a) Target audience. Who is the site or app for?

The app/site is designed for anyone who wishes to either chat or join a community. The user has a choice to either post things, chat using voice or video or even join a community that is abundant with people. The users in question can range from either workers wanting to work together, people wanting to have fun either by joining a community or by playing with friends

b) What do they expect to find or do there? What is the objective of this website or app?

The objective of this app/website and what people expect to find in said app/website is for individuals to either enjoy themselves with friends or colleagues or even discuss things from jobs, schools or even communicate with teams if assigned a project. This in turn allows many individuals to chat about anything that they find fond of or simply need something to work on. The app allows many individuals a way to quickly chat with colleagues or random people.

c) Is this website or app's primary aim to inform, to sell, or to amuse?

The website/apps primary aim may be all three as this is a voice chatting app. The app in question contains many features that can apply to all three for example a community or server can be made in which the user is able to sell or even inform other users about anything. When it comes to amusement the users can either chat with each other, talk about anything or even chat during a gaming session.

d) Does the website or app need to clearly convey a brand's core message, or is it part of a wider branding strategy with its own unique focus?

I think the app/site has its own unique focus because similar apps have similar features but not all the features take for example the communities or servers for instance many individuals are able to post or share anything they really want when similar apps like zoom or Microsoft teams are usually for voice chatting and discussing the current issue that multiple individuals may have.

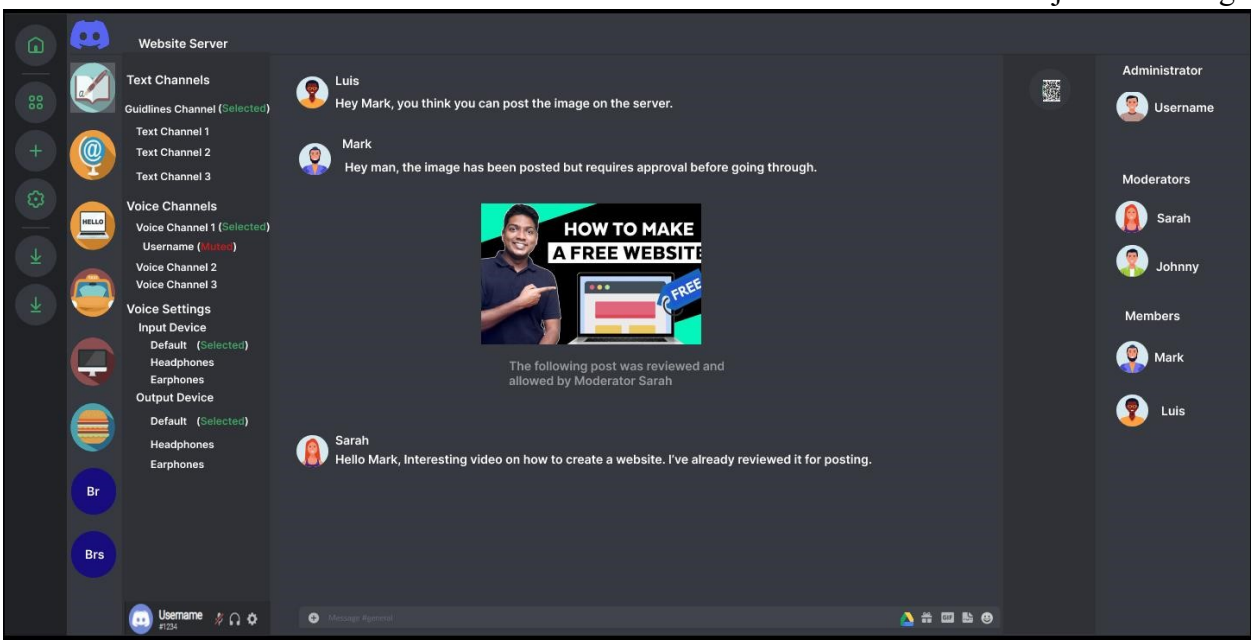

e) What competitor sites or apps, if any, exist, and how should this site or app be inspired by/different than, those competitors?

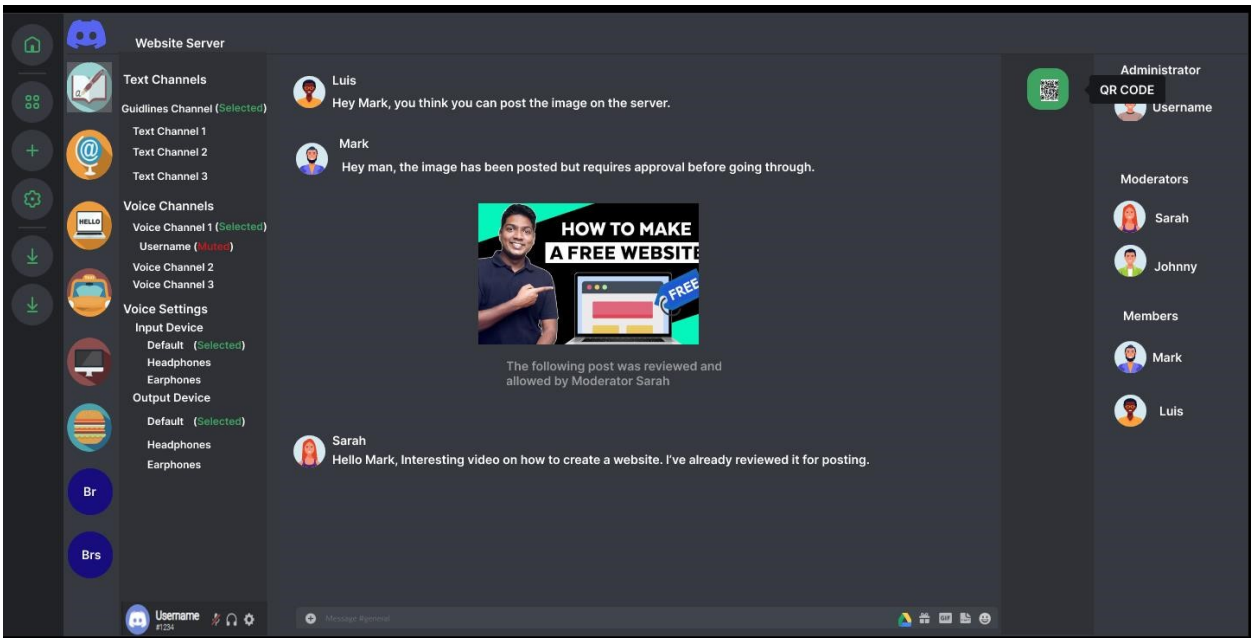

Other competitors are websites or apps such as skype, zoom, Microsoft team, etc. These apps/sites allow the users to either voice or video chat. The app/site that was chosen for this assignment acts similar and different from these apps/sites. Discord allows for multiple people to join a server and stay connected until the user decides to leave while other applications usually have a time limit and is more in keen for say a

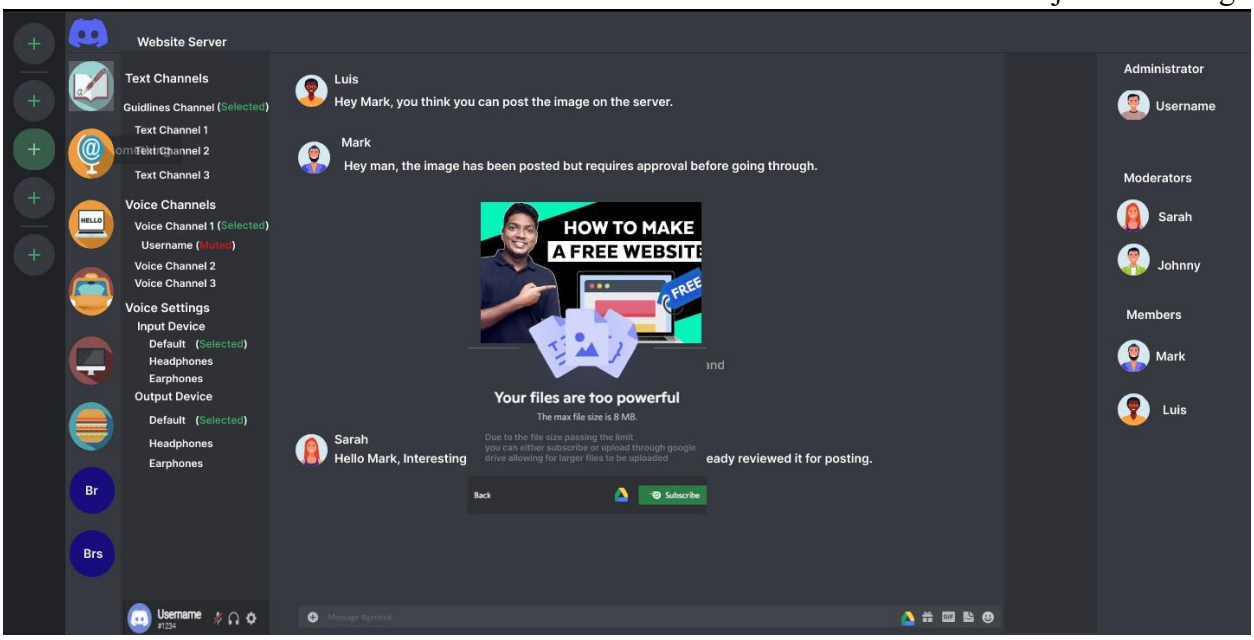

business approach like a meeting or scheduling a lecture online. One downside that might be found on other apps/website is the ability to send files that have more sizes for example a file that is 8 gb. Discord would say this file is too powerful while other apps/sites would allow said file to simply be transferred over

Part 3 Redesign:

Below are three screenshots in which each violation has been fixed with a redesign. The utility violation is fixed by instead of making the user pay for a subscription that will increase the size of files they are able to upload. This works by giving a google drive option in which the file is uploaded and a link is provided to download said file. The safety and effectiveness violations are fixed by when a user posts in said server they have to wait till an admin or moderator approves the post to ensure that said image or post is safe. Effectiveness and consistency violation is fixed by providing an easy way to access the voice settings and now shows the username if they are muted with a red text. This will allow for the ease of simply clicking the setting and seeing if it is indeed the application causing the issue instead of browsing through an abundant amount of settings. Furthermore, the fixes for the violations of affordances and visibility are as follows the affordance issue can be fixed by providing the option of clicking a button that will provide said user if a qr code which they can then choose to give allowing for a simple approach of simply joining the server and being able to chat. This option will likely play out like this a user is in a chat and wishes to invite another individual that has never used discord they would receive a qr code from said user that will connect them to the chat immediately. Visibility is fixed by each time a server is created and just so happens to contain the same name the image will change or the letters will change in this case instead of two servers with the name Bs it'll be one Bs and the other Brs.
